                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      prostate neoplastic condition. The method involves (a) contacting a specimen from the individual with an androgen responsive prostate specific (ARP)15 binding agent that selectively binds an ARP15 polypeptide; (b) determining a test expression level of ARP15 polypeptide in the specimen; and (c) comparing the test expression level to a non-neoplastic control expression level of ARP15 polypeptide, where an altered test expression level as compared to the control expression level indicates the presence of a prostate neoplastic condition in the susceptibility to a prostate neoplastic condition or for treating or reducing severity of a prostate neoplastic condition. The present sequence represents a human ARP13 polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GTPase-activating protein; GTPAP; cell signalling; cell proliferative disorder; colon cancer; immune human; Rho GTPase activating protein 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or reducing the severity of a prostate neoplastic condition in an individual. The polymucleotides, polypeptides and methods of the invention are useful for diagnosing and treating prostate cancer. sequence represents a human ARP polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human androgen responsive prostate specific (ARP) polynuclectides and the polypeptides they encode. The invention also relates to a method of diagnosing or predicting susceptibility to prostate neoplastic condition in an individual and a method for treating prostate neoplastic condition in an individual and a method for treating prostate neoplastic condition in an individual and a method for treating prostate neoplastic condition in an individual and a method for treating prostate neoplastic condition in an individual and a method for treating prostate neoplastic condition in an individual and a method for treating prostate neoplastic condition in an individual and a method for treating prostate prostate specific condition in an individual and a method for treating prostate prostate specific condition in an individual and a method for treating prostate prostate prostate specific condition in an individual and a method for treating prostate prost
                                    New GTPase-activating proteins designated GTPAP-1 and its variant GT are useful to diagnose, stage, treat and monitor cell signaling and proliferative disorders, particularly colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human Rho GTPase activating protein 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADM83551;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                            (BSNA) molecule which comprises a nucleic acid sequence encoding any of the 107 breast specific protein (BSP) amino acid sequences fully defined in the specification. The molecules of the invention demonstrate cytostatic activity and may be useful for diagnosing, preventing or treating breast cancer, possibly via vaccine production or gene therapy. The current sequence is that of a human breast cancer-related protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               their encoding cDNAs. The protein is used to diagnose, stage, treat monitor cell signalling, immune and cell proliferative disorders, particularly colon cancer. The present sequence is human Rho GTPase activating protein 8 used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            New breast specific nucleic acid molecules and polypeptides useful diagnosing, preventing or treating breast cancer, for producing transgenic animals or cells, or for research purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   05-DEC-2002;

Disclosure; SEQ ID NO 3; 62pp; English.

The invention relates to a polypeptide sharing one or more homologous amino acid domains with a Legless (Lgs) protein and is therefore a functional homologue of Lgs. The invention also relates to a nucleotide sequence encoding a protein present in invertebrate and/or vertebrate organisms, the nucleotide sequence encoding a protein comprising a positive function in a regulatory pathway and the use of the polypeptide for the isolation of Lgs-binding proteins by carrying out an assay chosen from an in vitro binding assay with such a peptide or a co-immunoprecipitation from vertebrate or invertebrate cell lysates or a mammalian or yeast two hybrid assay. The polypeptide and polynucleotide

which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples and comparing the protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vertebrate Lgs protein homologues or fragments, antibodies, antibody fragments, 1gs antisense DNA, 1gs antisense RNA, 1gs double-stranded RNA, small peptides or chemical and natural compounds being capable of interfering with Lgs function, synthesis and degradation. The disorders are related to cell differentiation or cell proliferation. The compound is administered to treat a cancerous condition by preventing progression from a pre-neoplastic or non-malignant condition to a neoplastic or malignant state. The cancerous condition is characterised by overstimulation of the Wnt pathway and is medulloblastoma or cancer of the colon, breast, head and neck, brain, thyroid or skin. The therapeutic compound may also be administered to a blood disease to promote tissue regeneration and repair whiseered to a blood disease to promote tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sarcoma

                                                                       This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (1gs) protein, a downstream component of the Wnt/Wingless (Wnt/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Wnt pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be use to promote tissue regeneration and repair. This sequence represents the human legless (1gs) protein homologue 1gs/bc19 described in the

                                                                                                                                                                                                                                                                                                           The invention relates to novel legless (1gs) proteins and polynucleotides encoding such proteins. Igs sequences are useful for the treatment of disorders of cell fate such as differentiation or proliferation. The invention is used to treat blood disease or a cancerous condition characterised by over-stimulation of the Wnt pathway such as colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer and is administered to prevent progression from a pre-neoplastic or non-malignant condition to a neoplastic or malignant state. It is administered to promote tissue regeneration and repair. The invention is also useful in the therapy of diseases cost by an over-activation of Wg pathway. It is useful for reducing 1gs gene expression in an invertebrate or vertebrate organism or an invertebrate or vertebrate cell line. The invention is also useful in gene therapy. The present sequence is human log/bc1e protein useful in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Legless cancer;

                                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Leber's hereditary optic neuropathy; LHON; mitochondrial encephalopathy lactic acidosis and stroke; MELAS; myoolonic epilepsy ragged red fibre syndrome; MERRF; cancer; neuroprotective; nootropic; antidiabetic; anticonvulsant; antiarthritic;

Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis

Claim 20; Page 256-257; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and convention also relates to vectors and recombinant host cells comprising a conclusive fine the invention, methods of producing the novel polypeptides, and the polypeptides of the invention, methods of detecting the nucleotides of producing the novel polypeptides, and methods of identifying compounds which convergence in a sample, and methods of identifying compounds which convergence in the polypeptides, methods of identifying compounds which convergence in the polypeptides of the invention and methods of identifying compounds which convergence in the polypeptides of the invention may of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differential therapeutic applications. The polypeptides of the invention or cell differential therapeutic; probable biological activity; in the invention or cell differential therapeutic; activity; tissue growth activities; chemotactic or chemotheric activities; activities; haemostatic, thrombotic or thrombotic or thromboty activity; activity tissue growth activities; or may be conditions on their biological activities, haemostatic, thrombotic or involved in oncogenesis, cancer cell proliferation or metastasis.

Compending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions medical conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions and decrease, conditions and uncers), and abnormal conditions (e.g., of burns, incisions and ulcers), while those with

the encoded proteins (AAO00010-ÅAO13910) that exhibit activity elating to tytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N-PSDB;

                                                  The invention relates to novel legless (1gs) proteins and polynucleotides encoding such proteins. Igs sequences are useful for the treatment of disorders of cell fate such as differentiation or proliferation. The invention is used to treat blood disease or a cancerous condition characterised by over-stimulation of the Wnt pathway such as colon, breast, head and neck, brain, thyroid, medulloblastcma or skin cancer and is administered to prevent progression from a pre-neoplastic or non-malignant condition to a neoplastic or malignant state. It is administered to promote tissue regeneration and repair. The invention is also useful in the therapy of disease cost by an over-activation of Wg pathway. It is useful for reducing 1gs gene expression in an invertebrate or vertebrate organism or an invertebrate or vertebrate cell line. The invention is also useful in gene therapy. The present sequence is prosophila species legless (1gs) peptide

                                                                                                                                              The invention relates to a polypeptide sharing one or more homologous CC amino acid domains with a Legless (Lgs) protein and is therefore a CC functional homologue of Lgs. The invention also relates to a nucleotide condition of Lgs. The invention also relates to a nucleotide cC sequence encoding a protein present in invertebrate and/or vertebrate according a protein of Lgs-binding proteins by carrying out an assay chosen cC for the isolation of Lgs-binding proteins by carrying out an assay chosen cC immunoprecipitation from vertebrate or invertebrate cell lysates or a cc mammalian or yeast two hybrid assay. The polypeptide and polynucleotide care useful for treating disorders of cell fate, which involves carrying related to treating disorders of cell fate, which involves care useful for treating disorders of cell fate, which involves care useful for treating and natural compounds being capable of cragments, lgs antisense DNA, lgs antisense RNA, lgs double-stranded RNA, carrying with Lgs function, synthesis and degradation. The disorders care related to treat a cancerous condition by preventing progression from a pre-neoplastic or non-malignant condition to a neoplastic or cancerous to the Wnt pathway and is medulloblastoma or cancer of the compound may also be administered to brain, thyroid or skin. The therapeutic compound may also be administered to a concer of the compound is medulloblastoma or cancer of the compound may also be administered to a procential to a promote tissue

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL18176-ABL30511), expressed DNA sequences (ABL0840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                       D. melanogaster lgs protein.
                                                                                                                                                                                                                                                                          AAB71228

                                                                                             Legless cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (1gs) protein, a downstream component of the Wnt/Wingless (Wnt/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Wnt pathway, where the cancerous condition is colon, breast, head and neck, brain,
                                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila melanogaster (fruitfly) legless disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                               where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the Drosophila melanogaster (fruitfly) legless (lgs) protein described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel

Logs sequences are useful for the treatment of disorders of cell fate such as differentiation or proliferation. The invention is used to treat blood disease or a cancerous condition breast, head and neck, brain, thyroid, medulloblastoma or skin cancer and is administered to prevent progression from a pre-neoplastic or non-malignant condition to a neoplastic or malignant state. It is administered to promote tissue regeneration and repair. The invention is also useful in the thorapy of disease cost by an over-activation of Wg pathway. It is useful for reducing 1gs gene expression in an invertebrate or vertebrate organism or an invertebrate or vertebrate cell line. The invention is also useful in gene therapy. The present sequence is brosophila species legless (1gs) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2003-829432/

CC positive function in a regulatory pathway and the use of the polypeptide
CC for the isolation of Lgs-binding proteins by carrying out an assay chosen
CC immunoprecipitation from vertebrate or invertebrate call lysates or a
CC mammalian or yeast two hybrid assay. The polypeptide and polynucleotide
CC are useful for treating disorders of cell fate, which involves
CC administering therapeutic compounds chosen from invertebrate and
CC vertebrate Lgs protein homologues or fragments, antibodies, antibody
CC fragments, lgs antisense DNA, lgs antisense RNA, lgs double-stranded RNA,
CC small peptides or chemical and natural compounds being capable of
CC interfering with Lgs function, synthesis and degradation. The disorders
CC are related to cell differentiation or cell proliferation. The compound
CC is administered to treat a cancerous condition by preventing progression
CC from a pre-neoplastic or non-malignant condition by preventing progression
CC malignant state. The cancerous condition is characterised by over-
CC stimulation of the Wnt pathway and is medulloblastoma or cancer of the
CC colon, breast, head and neck, brain, thyroid or skin. The therapeutic
CC regeneration and repair. This sequence represents the Drosophila Lgs
CC conformation of the first in the compound of the compound condition of the worth of the compound of the compound condition condition of the compound condition condit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence encoding a protein present in invertebrate and/or vertebrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a polypeptide sharing one or more homologous amino acid domains with a Legless (Lgs) protein and is therefore a functional homologue of Lgs. The invention also relates to a nucleotide
                                                                                                                                                                                                                                                                                        musculus

The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence of mouse beta-catenin nuclear
The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Tab in the specification). ABN15762 to ABN27252 encode the human ORFX
                                                                                                                                                                 Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
```

The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence

                                                                                  production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiseis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           represents the amino acid sequence of mouse beta-catenin nuclear localised protein #2
                                                                                                                                                                                                                                    The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; cytokine; cell proliferation; cell differentiation; vaccine; peptide therapy; stem cell growth factor; haemato tissue growth factor; immunomodulatory; cancer; leukaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAO07544;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                     EP1033405-A2

The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL61840-ABL16175) and the encoded proteins (ABB5737-ABB772072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disord neurological disease; infection; human; secreted protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
```

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myccardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, baterial, fungal and parasitic

marrow and ä

                                                                                                                                                                                                                                                                 sequences. (I) is useful as hybridisation proces, polymerus, reaction (PCR) primers, oligomerus, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders.
                                                                                                                                                                        involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to human aminoacyl-tRNA synthetases (ATRS) and their corresponding nucleic acids. ATRS is useful in screening for a compound that modulates the activity of the polypeptide or that binds to the polypeptide. ATRS is also useful as an immunogen for preparing polyclonal or monoclonal antibodies by hybridoma technology. The agonist and antagonist of ATRS are useful for treating a disease or condition associated with decreased or overexpression of functional ATRS in a patient. ATRS, its DNA and its modulators are useful for diagnosis, treatment and prevention of cell proliferative disorders such as cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            systemic lupus erythematosus; systemic sclerosis; ulcerative colitis; haemodialysis; uveitis; infection; single nucleotide polymorphism; gene therapy; cytostatic; dermatological; antiulcer; antibacterial; virucide; antiparastic; protozoacide; tranquilliser; vulnerary; human immunodeficiency virus; antiinflammatory; nephrotropic;

ATRS DNA is also useful for generating hybridisation probes useful in mapping the naturally occurring genomic sequence and oligonucleotide primers derived from it are useful to detect single nucleotide polymorphisms. ATRS DNA is used in gene therapy. The present sequence is human ATRS-3 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; open reading frame; ORFX; detection; cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; osteopathic; antiparkinsonian; immunosuppressant; cardiant; immunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic;

CC The invention relates to human tumour-associated antigenic target (TAT) CC polypeptides, and their related nucleic acids. The TAT polypeptides are CC overexpressed in cancer tissues compared to normal tissues, and may thus CC serve as effective targets for the diagnosis and treatment of cancer in CC mammals. The invention also relates to nucleic acid and polypeptide CC sequences at least 80% identical to the TAT nucleic acids and CC polypeptides, expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic CC acid; an antibody specific for a TAT polypeptide; a peptide or organic CC molecule which binds to a TAT polypeptide; fusion proteins comprising a CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, CC diagnosis of cancer, particularly cancers such as breast cancer, CC increased TAT expression, particularly cancers such as breast cancer, CC cancer, pancreatic cancer, cervical cancer, liver cancer, bladder CC cancer, pancreatic cancer, cervical cancer, cancers of the central CC cancer, pancreatic cancer, cervical cancer, cancers of the central CC used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence CC represents a TAT polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁

                                                                                                                                                                                                                                                           ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel human aminoacyl tRNA synthetase CC designated ATRS-1 (ABB08919) and cDNA encoding it (ABA97729). ATRS-1 is CC thought to be a valyl-tRNA synthetase, based on its 50% homology to mouse CC valyl-tRNA synthetase, based on its 50% homology to mouse CC valyl-tRNA synthetase and the presence of a tRNA synthetase Class I (I, CC L, M and V) domain. Class I enzymes such as ATRS-1 contain a catalytic CC domain based on a nucleotide-binding motif known as the Rossman fold, and CC add amino acids to the 2' hydroxyl group at the 3' end of tRNAs. ATRS-1 cC cucleotides, polypeptides, agonists and antagonists may be used for CC diagnosing, treating or preventing disorders associated with aberrant CC expression of aminoacyl tRNA synthetases. Such disorders include cell CC cirrhosis and hepatitis); autoimmune or inflammatory disorders (e.g., cancers, psoriasis, atherosclerosis, CC allergies, AIDS (acquired immunodeficiency syndrome), anaemia, diabetes, CC dermatomyositis, polymyositis and rheumatoid arthritis); trauma; and CC viral, bacterial, fungal, parasitic, protozoal or helminthic infections. They are also useful in screening for modulators of ATRS-1 expression or artivity. The present sequence represents human aminoacyl tRNA synthetase
                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Leber's hereditary optic neuropathy; LHON;

                                                                                                                                                                                                                                                                                                                                      cc molecules encoding a kinase polypeptide. The nucleic acid molecules comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a c complement of (a); (c) hybridizes under stringent conditions to (a) and c complement of (a); (c) hybridizes under stringent conditions to (a) and c complement of (a); except that it lacks one or more, but not all, of an collegation of the control of the conditions to an except that it lacks one or more, but not all, of an c c c terminal domain, a coiled-coil structure region, a spacer region and a c-c terminal tail; or (e) is a complement of (d). The nucleic acid molecules, c polypeptides, methods and substance are useful for treating cancers, c meuronal-associated diseases, and metabolic disorders. The disorders are preferably cancers of the tissues or of hematopoietic origin, disease, c the central or peripheral nervous system, Alzheimer's disease, c c c the central or peripheral nervous system, Alzheimer's disease, c c c viral infections, infections caused by prions, infections caused by fungi, ocular diseases, migraines, pain, c sexual dysfunction, mood disorders, accular diseases, cognition of isorders, cognition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for detecting remote polypeptide homologues, comprising analysis of conserved secondary structure pattern in a protein family, and conserved active site an acid residues. The analyses are used to identify conserved residues

                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                        CC heterologous polypeptide. (I) has antidiarrheic and antibacterial CC activities, and can be used as an inhibitor of Salmonella. (I) (which is CC a probe) is useful for the detection and/or identification of CC Bifidobacterium longum in a biological sample. A carrier containing the CC lactic acid bacterium Bifidobacterium longum NCC2705 (CNCM I-2618) can be CC used for preventing and/or treating diarrhoea brought about by pathogenic CC bacteria and/or rotavirus. The carrier is a food composition selected CC products, cice-creams, fermented cereal based products, milk based fermented CC products, ice-creams, fermented cereal based products, milk based CC powders, infant formula, pet food or a pharmaceutical composition CC selected from tablets, liquid bacterial suspensions, dried oral CC supplement, wet oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or Chips to carry out analysis of the CC expression of the Bifidobacterium gene. ABG81844 to ABG81850 represent CC Listing from the present invention but not mentioned further within the Sequence data for this patent is not represented CC in the printed specification but is based on sequence information CC supplied by the European Patent Office
                                                                               RESULT 36
                                                                                                                                                                                                              Query Match

Also described is a polynucleotide (II) encoding fusion protein, comprising a sequence selected from 1097 sequences given in ABP65258 to ABP6354 ligated in frame to a polynucleotide encoding a heterologous polyneride (II) has apridication and applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bifidobacterium longum NCC2705; Bifidobacterium; bacterial; antidiarrheic; antibacterial; inhibitor of Salmonella; detection;

Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                   of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polymucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    biofilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a
                    Aspergillus
                                                           16-APR-2003
                                                                                                  ABJ26489
                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                       factors. This sequence represents a protein of of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23-APR-2001; 2001US-0285697P.

                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel purified or isolated nucleic acids of CC essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic corganism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a comprising A. fumigatus. The polynucleotides are useful for characterisation, screening or corganisms invade or reside, for comparing with the DNA sequence of A. CC fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify optential orthologous essential or virulence genes, for selecting and comparing of comparing or comparing with DNA sequences of other related or distant pathogenic organisms to identify on antipodice or antipodice, as an antipodice or identify on antipodice or comparing with DNA comparing of other related or distant pathogenic organisms to identify on antipodice or identify on antipodice or comparing with DNA comparing of or antipodice or comparing with DNA comparing of openical antipodices, as an antipodice or antipodice, and to identify inhibitors of the binding course or to identify inhibitors of the binding course or to identify inhibitors of the binding course of the protein in biological fluids, as a marker for comparing with pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence corganism invade or reside, and to isolate correlative receptors or ligands in the case or virulence corganism invade or reside, and to isolate organism such antipodice of the essential genes of happergillus fumigatus of the invention
                                                                                                                                                                                                                                               Best Loc

                                                                                                                                                                     The invention relates to gene repair function associated protein-34.1 (ADC50023) and nucleic acids encoding it (ADC50022). The protein has a molecular weight of 34.1 kD, and has 34% identity and 47% homology over 235 amino acid stretch with an Arabidopsis thaliana DNA repair protein-like protein (GenBank accession number AB016875). The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Gene repair function associated protein-34.1 can be used in the treatment of a variety of diseases such as cancer, blood diseases, HIV (human immunodeficiency virus) infection and immune disorders. The present sequence represents gene repair
                                                                                                                                                                                                                                                                                                                                                                                      New gene repair function associated protein-34.1, encodi polynucleotide, antagonist, and recombinant production, treating cancer, hemopathy, HIV and immune diseases.
